

Connections

Each module in this course is approached as a stand-alone topic, however in reality these topics build upon each other and/or the concepts are critical to understanding the function or process addressed in other modules. Just like in nature where all living things are connected at some level, the concepts covered in these modules connect to each other. These exercises are to be done at the completion of each module to help you make those connections. The bubbles contain the module topics. Your task is to identify the connections and summarize it on the line between the bubbles. Empty bubbles are provided so that you can add additional connections. You may add additional lines between bubbles.

- Module Topics
- Scientific Method
 - Microscopy
 - Chemistry
 - Properties of water
 - pH
 - Buffers
 - Proteins
 - Carbohydrates
 - Lipids
 - Cells Structure
 - Membranes
 - Enzymes
 - Respiration
 - Photosynthesis
 - Cell Division
 - DNA
 - Biotechnology
 - Plants
 - Evolution

1. How are microscopy and cell structure connected?
2. How does chemistry help us with identifying cell structures and their composition?
3. How does the microscope help demonstrate osmosis and the function of membranes?
